

Functional & Performance Testing

Metro Ticket Generating System

Date	7 September 2026
Team ID	SWUID2026191970
Project Name	Metro Ticket Generating System in ServiceNow
Maximum Marks	

Test Scenarios & Results

The following functional and performance test cases are prepared for the Metro Ticket Generating System. Actual Result and Pass/Fail should be updated after executing each test.

Test Case ID	Scenario (What to test)	Test Steps (How to test)	Expected Result	Pass/Fail
FT-01	Station Selection Validation	Select valid and invalid values in Starting From and Going To fields.	Valid metro stations are accepted and invalid/incomplete station selections are prevented.	pass
FT-02	Journey Type Validation	Select Single Journey and Return Journey.	The selected journey type is accepted and the corresponding fare field is handled correctly.	pass
FT-03	Passenger Number Validation	Select the available passenger count values and test an invalid/empty value.	Valid passenger count is accepted; missing or invalid passenger count is prevented.	pass
FT-04	Fare Calculation Test	Select source, destination, journey type and number of passengers.	Fare is automatically calculated according to the selected route, journey type and passenger count.	pass
FT-05	Payment Mode Validation	Select UPI, CARD and Others.	Each configured payment mode is displayed and can be	pass

			selected.	
FT-06	Ticket Submission Test	Enter all required booking details and submit the ticket request.	The metro ticket request is submitted successfully with the entered journey details.	pass
FT-07	QR Ticket Generation Test	Complete a valid booking and initiate the QR-ticket generation flow.	A digital QR code/ticket is generated and displayed to the passenger.	pass
FT-08	Required Field Validation	Leave one or more mandatory booking fields empty and attempt submission.	The system identifies the missing required information and prevents incomplete submission.	pass
PT-01	Response Time Test	Use a timer to check the response time when changing route, journey type and passenger count.	Fare calculation and form response should occur without noticeable delay.	pass
PT-02	QR API Response Test	Trigger QR generation and observe the response from the QR-code generation API.	The QR API should respond successfully and the QR image should be displayed.	pass
PT-03	Multiple Booking Load Test	Execute multiple booking submissions sequentially and, where supported, from multiple sessions.	The system should continue to process bookings without errors or crashes.	pass

Testing Summary

- Functional testing covers station selection, journey type, passenger count, fare calculation, payment mode, submission, QR generation and required-field validation.
- Performance testing covers response time, QR API response and handling of multiple booking operations.
